

The annotations are brief but interesting and are supplemented by detailed notes on the colors of the irides, bill, feet, etc., based on comparison of the fresh specimen with the plates in Mr. Ridgway's 'Nomenclature of Colors.' Though sadly handicapped by failing health Mr. Jouy's love of his favorite pursuit showed no diminution, and the material for this, his last paper, was gathered under conditions to which most naturalists would have succumbed.—F. M. C.

Verrill on the Birds of Dominica.¹—Mr. A. H. Verrill collected in Dominica during March, April, and May, 1890, and was joined by his brother, the author of this paper, "the latter part of April." As a result of their combined ornithological researches in several parts of this wild and rugged island he presents a well-annotated list containing 54 species, including 5 species not given by previous writers, thus raising the number of Dominican birds to 64. *Geotrygon mystacea*, of which no specimens were preserved, has since been procured by the writer of this review from a local collector.

Several other species are included on the descriptions of natives or as observed but not collected, and although it is quite probable these species actually occur, a little more conservatism in this direction would have been advisable. *Vireo calidris*, given as "very likely" a summer visitor only, was found by the reviewer to be a common bird during the past February.

Interesting notes on habits and local distribution are presented, but by far the most valuable part of this paper consists in observations, many of them entirely new, on the nesting of twenty species of Dominican birds, among which *Falco columbarius* is included. Half-tone figures of the nests of seven and eggs of three of these are given. It appears that in Dominica the breeding season is nearly over by the latter part of April, at which time it is approaching its height in Trinidad. The difference in time, however, is apparently not a real one but is due to the limitations of the Dominican avifauna. In Trinidad the nearest representatives of the twenty species found breeding by the Messrs. Verrill, so far as known, also breed before May 1, but many others have not then begun to nest.

Mr. Verrill does not seem to be familiar with Colonel Feilden's important paper on 'The Deserted Domicile of the Diablotin in Dominica.'²—F. M. C.
